

Goal (Theorem):

$K(s) \dots$

Writing the predicate: (There are facts (constraints))

$P(a, b, c, s_0)$

↑ chair at c
↑ monkey at banana position a

initial state

$P(z_1, y_1, z_1, s_2) :- P(x_1, y_1, z_1, s_1), \text{walk}(x_1, z_1, s_2)$

↑ position
↑ monkey some position as chair after it walks hit

$P(y_2, y_2, y_2, s_4) :- P(x_2, y_2, x_2, s_2), \text{carry}(x_2, y_2, s_3, s_4)$

↑ chair and monkey position is same after it carries

$r(s_6) :- P(b, b, b, s_5), \text{climb}(s_5, s_6)$

↑ reachable
? - r(s₆)

Blocks world

$\left\{ \begin{array}{l} \text{on}(A, B) \xrightarrow{s_0} A \text{ on top of } B \\ \text{clear}(A) \xrightarrow{s_0} \\ \text{clear}(C) \xrightarrow{s_0} \end{array} \right.$ is

This approach is situational calculus

Situational calculus

Frame Problem

position effect: predicate turned on
y is clear on top
↓ now

in this ex. $\text{on}(x, z)$, $\text{clear}(y)$

negative effect: predicate turned off

in this $\text{on}(x, y)$, $\text{clear}(z)$

$\text{on}(x, y, s) \wedge \text{clear}(x, s) \wedge \text{clear}(z, s) \wedge (x \neq z)$
 $\supset \text{On}(x, z, \text{do}(\text{move}(x, y, z), s))$

positive effect
axiom

negative effect

in this on(x,y), clear(z)

↑
this is destroyed (no longer)
so it is a negative effect
↑
z is no longer clear on top
move(x,y,z)

||

frame axiom
is has to
be explicitly
stated that
 $u \neq v$, $v \neq y$,
etc.

this is basically a
frame problem: - the
computer can't handle any
holes, so we must state
everything explicitly

Problem Solver

→ find an operation whose post conditions can reduce the difference
- the preconditions of the operation may become the new difference

until no difference

- we want the preconditions
of the last operator to
be satisfied by the
initial condition
- This is GPS (General
Problem Solver)

Example

① pickup(x).

p & 0: on table(x), clear(x), hand empty

↑
precondition deleted
✓
after it has

precondition, has to
be true

precondition deletion

after it has
been applied, it
will be deleted

Add list $\leftarrow A$: holding (x)

② putdown (x) :

P & D : Holding (x)

A : on table (x), clear (x), hand empty

③ stack (x, y)

P & D : Holding (x), clear (y)

A : Hand empty, on (x, y), clear (x)

④ unstack (x, y)

P & D : Hand empty

A : Holding (x), clear (y)

before we unstack,
hand has to be empty

get x from stack and
put it into hand

Initially (I) :

(Goal) :
